

EECS 151/251A

Discussion 5

Daniel Grubb 9/28, 9/29, 10/4

Administrivia

- Homework 4 due Oct 4th
- No new homework this week
- Lab 4 due Friday Oct 1st
- Lab 5 this week
- Midterm
 - Oct 7th, 7-8:30PM
 - Scope: all lectures and material through 10/4
 - Logistics details TBA

RISC-V

- “risk-five”
- Developed right here at Berkeley!
- Why RISC-V?
 - Free, flexible, extensible
 - Great for education in this course, and more and more prolific in industry
- [Look through the spec here!](#)
 - Includes RV32I for this class plus 64b, extensions, etc.
- Basis of the course project!

RISC-V Glossary

- **ISA** - Instruction Set Architecture
- **ALU** - arithmetic logic unit
- **PC** - program counter
- **Immediate** - a constant value used in instructions
- **Byte** - 8 bit value
- **Word** - 32 bit value (4 bytes; may be 64, etc. depending on implementation)
- **Half-word** - 16 bit value (or half of word length)

RV32I

Open

Reference Card

Base Integer Instructions: RV32I						
Category	Name	Fmt	RV32I Base	Category	Name	Fmt
Shifts	Shift Left Logical	R	SLL rd,rs1,rs2	Loads	Load Byte	I LB rd,rs1,imm
	Shift Left Log. Imm.	I	SLLI rd,rs1,shamt		Load Halfword	I LH rd,rs1,imm
	Shift Right Logical	R	SRL rd,rs1,rs2		Load Byte Unsigned	I LBU rd,rs1,imm
	Shift Right Log. Imm.	I	SRLI rd,rs1,shamt		Load Half Unsigned	I LHU rd,rs1,imm
	Shift Right Arithmetic	R	SRA rd,rs1,rs2		Load Word	I LW rd,rs1,imm
Arithmetic	Shift Right Arith. Imm.	I	SRAI rd,rs1,shamt	Stores	Store Byte	S SB rs1,rs2,imm
	ADD	R	ADD rd,rs1,rs2		Store Halfword	S SH rs1,rs2,imm
	ADD Immediate	I	ADDI rd,rs1,imm		Store Word	S SW rs1,rs2,imm
	SUBtract	R	SUB rd,rs1,rs2		Branches	Branch = B BEQ rs1,rs2,imm
	Load Upper Imm	U	LUI rd,imm		Branch ≠	B BNE rs1,rs2,imm

- Additional state?

RISC-V Instruction Formats

31	30	25	24	21	20	19	15	14	12	11	8	7	6	0				
funct7				rs2			rs1		funct3		rd			opcode		R-type		
imm[11:0]						rs1		funct3		rd			opcode		I-type			
imm[11:5]				rs2			rs1		funct3		imm[4:0]			opcode		S-type		
imm[12]		imm[10:5]			rs2			rs1		funct3		imm[4:1]		imm[11]		opcode		B-type
imm[31:12]										rd			opcode		U-type			
imm[20]		imm[10:1]				imm[11]		imm[19:12]			rd			opcode		J-type		

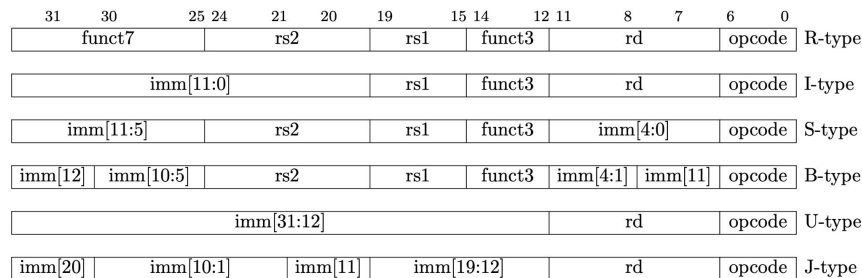

Design Patterns

imm[11:5]		rs2	rs1	funct3	imm[4:0]		opcode	S-type
imm[12]	imm[10:5]	rs2	rs1	funct3	imm[4:1]	imm[11]	opcode	B-type

- Load/store architecture: operate on registers, not directly on memory
- Decoding: designed for hardware efficiency
 - Fixed length (32b) instruction
 - Locations of register fields common among instructions (why?)
 - Immediate bit rotation for J- and B-type (why?)
 - Why skip lower bits of immediate?
- RV32I is enough to run any C program
 - Register loading, arithmetic, logic, memory load/store, branches, jumps
 - Additional pseudo-instructions (spec table 25.2, 25.3)
 - Reserved opcodes for extensions
- Additional resources beyond spec can be found in lecture and [CS61C](#)

Instruction Details

- Arithmetic (R-, I-)
 - ALU modes
 - Different versions of same instruction:
 - **slt, sltu, slti**
 - **srl, sra, srli**
- Load/store
 - Load: I-type, Store: S-type
 - Byte-addressing, little endian
 - Load/store granularity:
 - **sw, sh, sb**
 - **lw, lh, lhu, lb, lbu**
 - Sign extension

R-type assembly:
<inst> rd, rs1, rs2

I-type assembly:
<inst> rd, rs1, imm
<inst> rd, imm(rs1)

S-type assembly:
<inst> rs1, imm(rs2)

Instruction Details

- Conditional branches

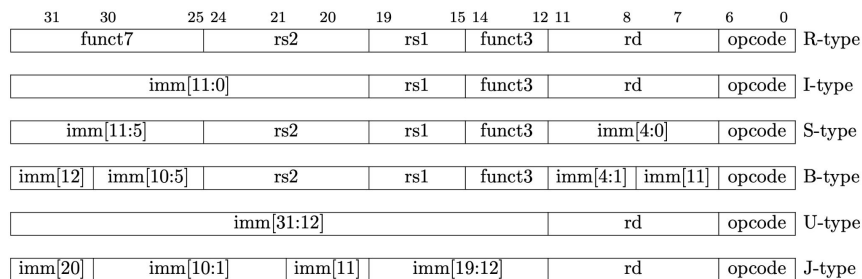

- B-type instructions are similar to S-type (what's different?)
- Branch comparison types - **bltu**, **blt**, **beq**

- Jumps

- **jal** (J-type), **jalr** (I-type)
 - 21b vs 12b
- Both write PC+4 to rd unless rd == x0

- Upper Immediate

- U-type used to get upper 20 bits of an immediate into rd
- **auipc** also adds immediate to current PC

B-type assembly:

<inst> rs1, imm(rs2)

J-type assembly:

jal rd, label

U-type assembly:

<inst> rd, imm

RISC-V CPU Implementation

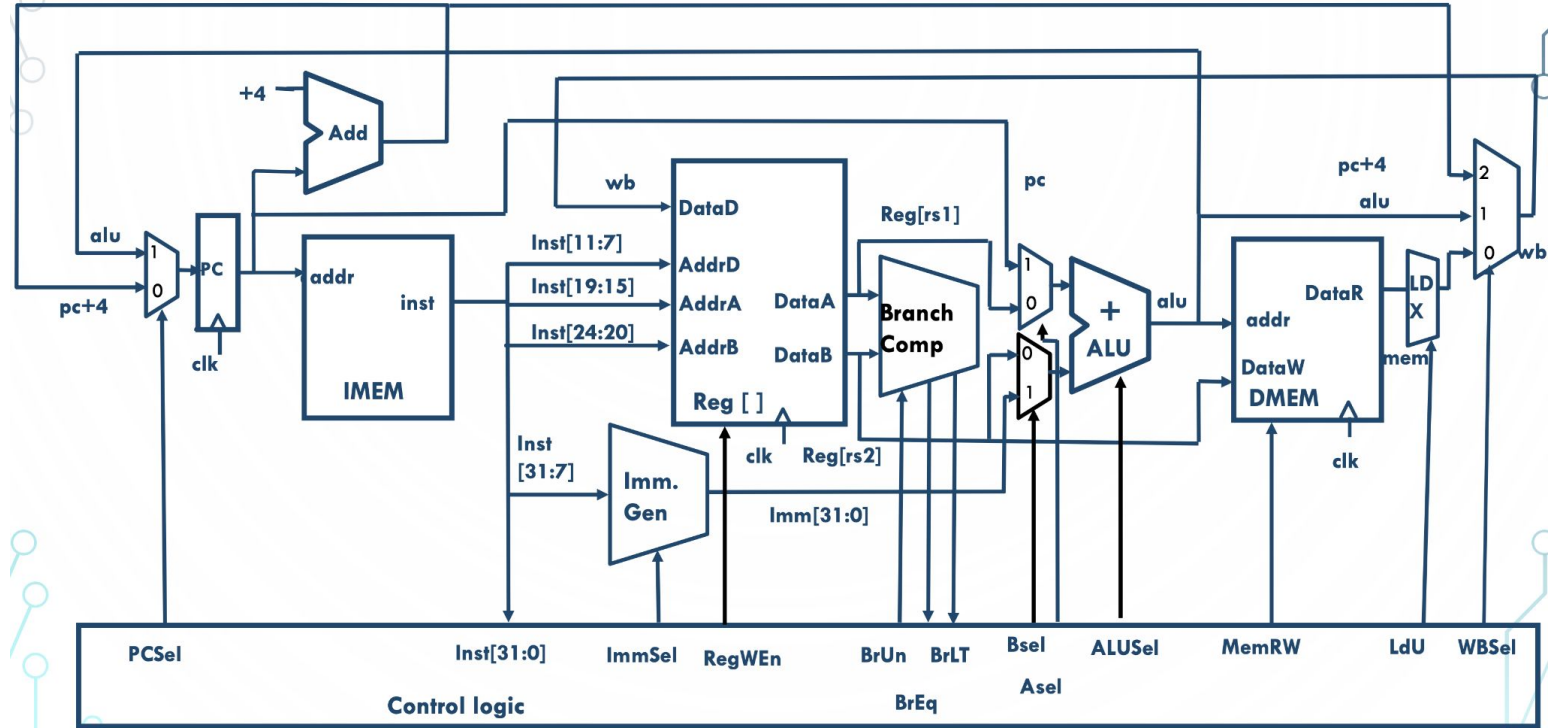

- Components
 - Datapath
 - Control
 - External memory

- Stages

-
-
-
-
-
-

RISC-V Datapath + Control

Control Signals

- Inputs

- Instruction (read from instruction memory)
- **BrEq**: inputs of branch comparison equal
- **BrLT**: input 1 less than input 2 of branch comparison

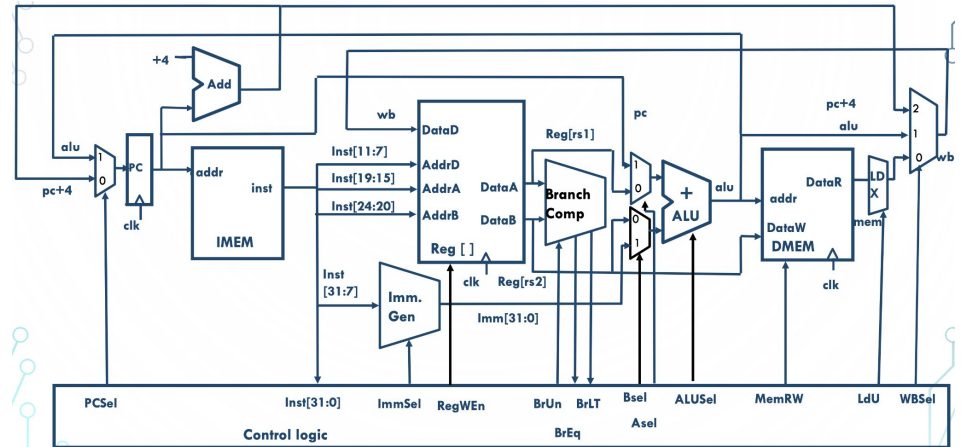

- Outputs

- **PCSel**: ALU output vs PC+4
- **ImmSel**: select 1 of 5 types (based on instruction type)
- **RegWEn**: enable writeback to register file
- **BrUn**: branch comparison unsigned mode (eg. bltu)
- **ASel/BSel**: select ALU inputs between (PC or Reg[rs1]) and (imm or Reg[rs2])
- **SLUSel**: select 1 of 10 operations
- **MemRW**: read from/write to data memory
- **WBsel**: rd data from data memory, ALU, or PC+4

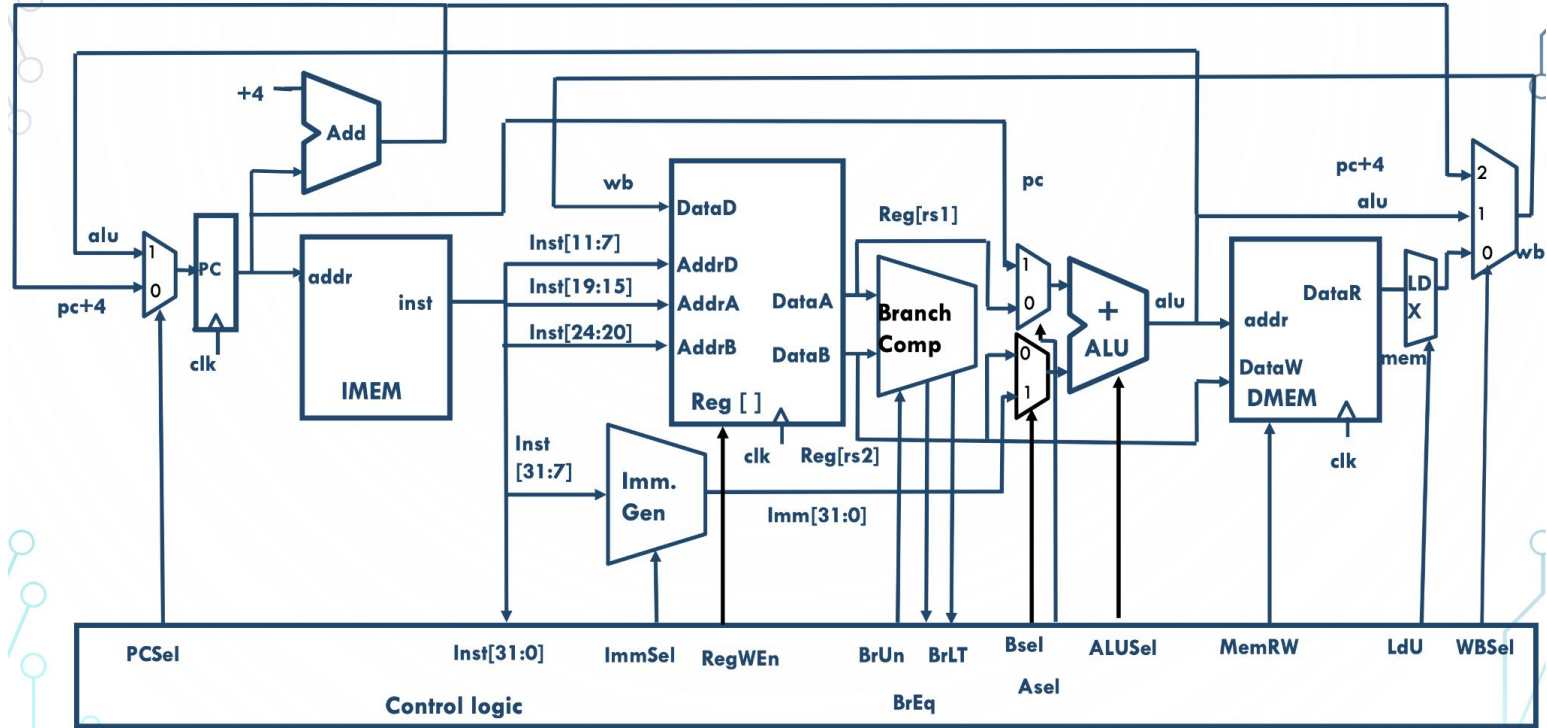

ALU Example

- 10 modes
- Incomplete example: (from past midterm)

```
wire signed [31:0] in1s, in2s;
assign in1s = in1;
assign in2s = in2;
always @(*) begin
    case (ALUSel)
        ADD:    alu = in1 + in2;
        SUB:    alu = in1 - in2;
        SHIFT_LEFT: alu = in1 << in2[4:0];
        LESS_THAN_S: alu = (in1s < in2s) ? 32'b1 : 32'b0;
        SHIFT_RIGHT: alu = in1 >> in2[4:0];
        OR:      alu = in1 | in2;
        AND:     alu = in1 & in2;
        PASS:    alu = in2;
    endcase
end
```

Pipeline Exercise

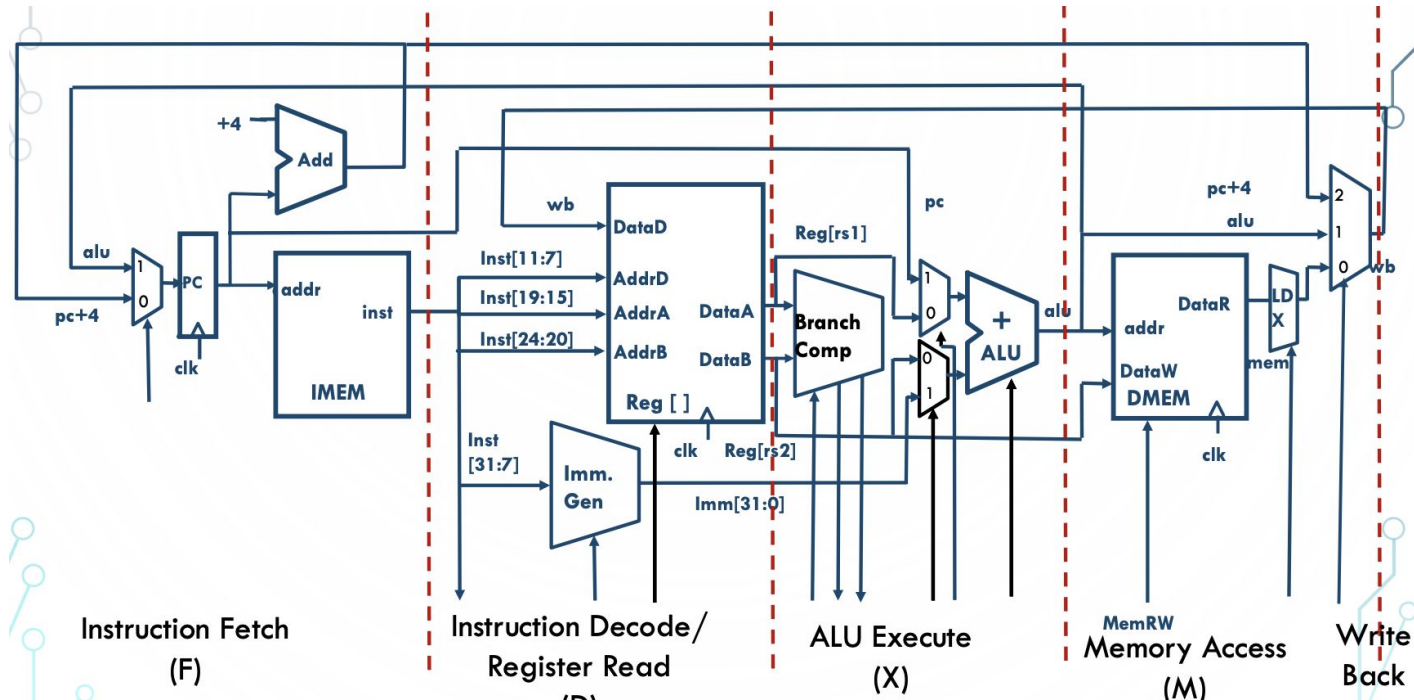

Pipeline Exercise

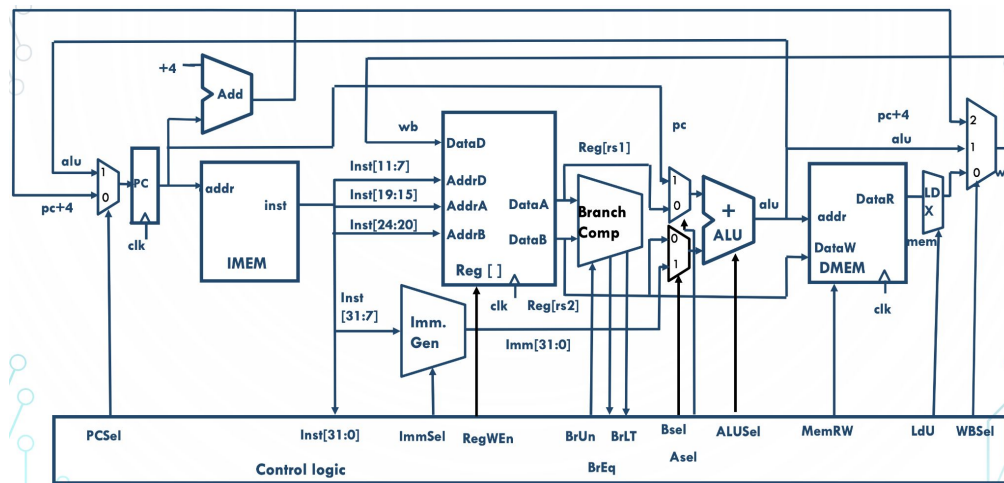

RISC-V Pipelining

- Why do we pipeline? Why not just single-cycle?

Hazards

- Pipelining is great! But what if...
 - in-flight instructions need the same functional unit?
 - in-flight instructions need the same data?
 - we need to check if we jump somewhere else?
- A hazard prevents instructions from being executed properly
- 3 main types
 - Structural
 - Data
 - Control

Hazard Types

- Structural
 - The resource that an instruction needs is busy
 - Eg. register file access, instruction & data memory
 - Generally avoided in RISC-V
- Data
 - Data dependency between instructions
 - Later instruction needs the output of a following instruction
 - But the pipeline stages!
 - Example?
- Control
 - Conditional branches - how do we know what instruction to execute?
 - Need execute stage to resolve?

Dealing with Hazards

- What's the easiest thing to do? Just wait!
 - stall/nop/bubble
 - But hurts CPI (cycles per instruction)
- Structural
 - Add more hardware
- Data
 - Writing and reading in the same cycle - speed of the RF
 - Forwarding
 - Adds additional logic to check dependencies; uses result directly
- Control
 - Guess one way, then fix if you're wrong!
 - Flush/kill instructions with control logic
 - Use branch prediction to reduce number of wrong guesses

Hazard Example

- Logic for fwd1 and fwd2?

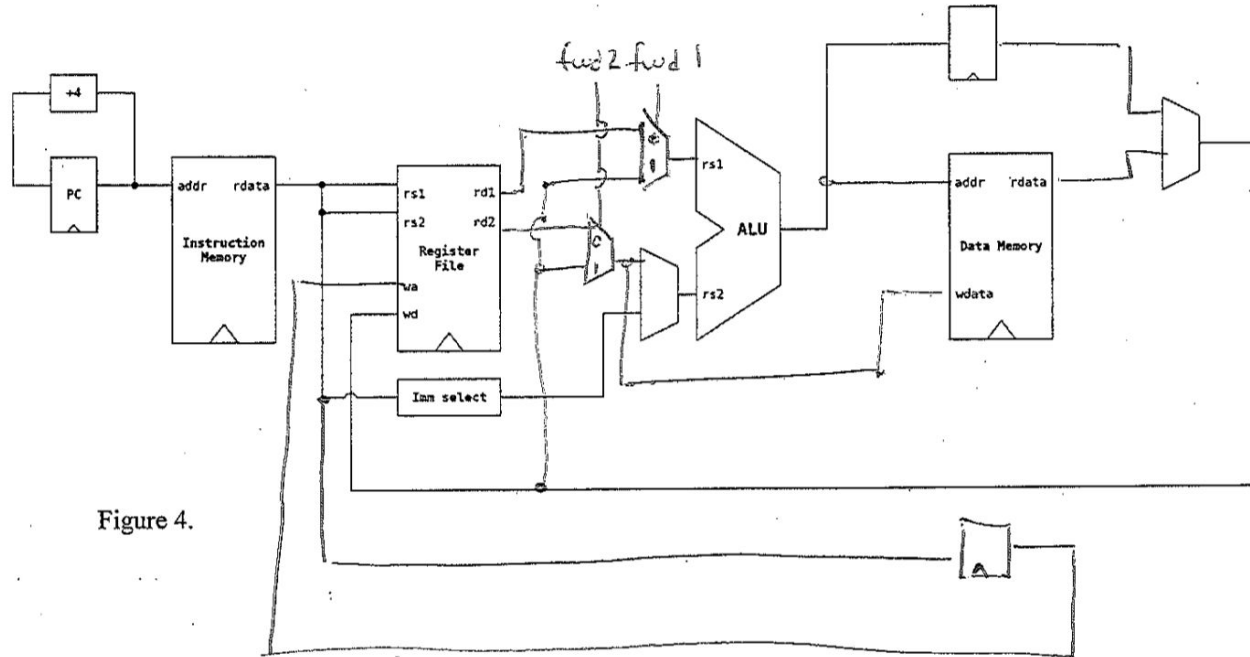

Figure 4.

RISC-V Recap

- Instructions and formats
 - Need to be able to understand break down instructions + assembly programs
 - Understand why the instructions are formatted the way they are
- Datapath + control logic
 - Understand the function, control, pipeline stages
 - Exercise the pipeline yourself!
 - Useful for the project
- Hazards
 - Types of hazards
 - Why do they arise?
 - How may they be fixed?
